

Kickoff / Briefing

Key Timelines

Agentic AI in Action

PSA Code Sprint 2.0 is an open-ended challenge where teams identify a problem relevant to PSA and **build an agentic AI solution that can reason, make decisions and coordinate actions** towards a defined objective.

Solutions may be **advisory, human-in-the-loop or autonomous**. Higher autonomy is not automatically better.

Teams should select an appropriate level based on use case, operational risk and available controls.

Evaluation Criteria

Agentic AI Design and Technical Execution

- Appropriate use of reasoning, decision-making, tool orchestration, state management and human oversight. Solution should demonstrate a reliable, working end-to-end workflow.
- Focus is on team-designed problem decomposition, workflow, integrations and implementation decisions, rather than generic capabilities of selected tools or platforms.

Innovation and Originality

- Creativity and originality of approach, including unique application of agentic AI to create highly differentiated value within the chosen problem domain.

Scalability, Security and Responsible AI

- Ability to scale across larger datasets or operational volumes, including runtime and resource efficiency, such as token usage. Also considers access controls, safety guardrails, error handling and auditability.

Presentation and Clarity

- Clear communication of problem, solution architecture, execution flow, key decisions and potential business impact.

Sprinternship

- ✓ ~2-months Sprinternship combining innovation sprints with mentorship
- ✓ Shortlisted teams work with PSA Biz and Tech experts to solve real-world port, logistics, and supply chain challenges using AI.
- ✓ Flexible participation with mentor guidance at key milestones.
- ✓ Gain industry exposure, hands-on problem-solving experience, and networking opportunities.
- ✓ Potential pathway to PSA internships and career opportunities.
